

NOTICE

Sale of 210 MW Gas Turbine Power Plant

Senoko Energy currently owns and operates two 105 MW V94 Siemens heavy duty Gas Turbines units (50 HZ, Year 1983).

Both GT units operate in open-cycle mode, solely on distillate-oil fuel. They generate at 10.5kV, and transmit electrical power at 66kV via a generator step-up transformer.

One GT unit is in active power pool bidding system, the other is in mothball state.

The power station's auxiliary voltage is 6kV and receives its incoming power from a 22kV substation. It is also equipped with black-start diesel engine generator to allow for total black-start conditions.

Senoko Energy is now soliciting proposals from potential buyers for these two GT units, together with their associated auxiliary and ancillary equipment.

Interested parties are required to express their interest to senoko.ppgt@senokoenergy.com.
